Entanglement makes QKD easy ...

- Entanglement-based QKD:
 - Local results are objectively **random**
 - Outcomes are **correlated** → raw Key
 - No RNG needed, neither at the sender, nor at the receiver.

Ding et al., "Polarization variations in installed fibers and their influence on quantum key distribution systems," Opt. Express 25, 27923-27936 (2017)

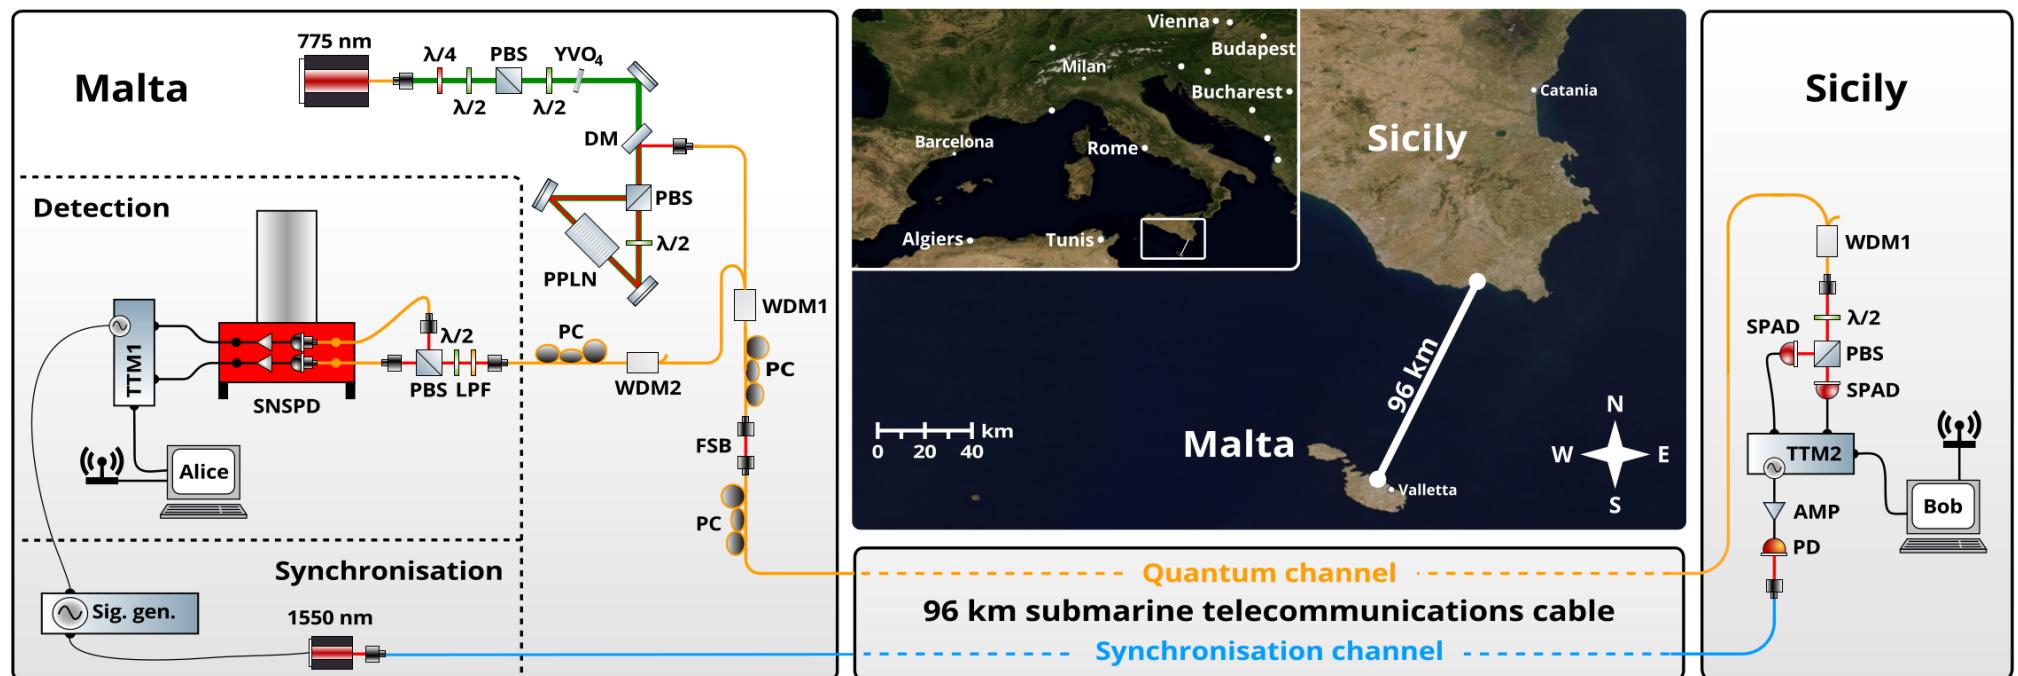

The Fiber Cable

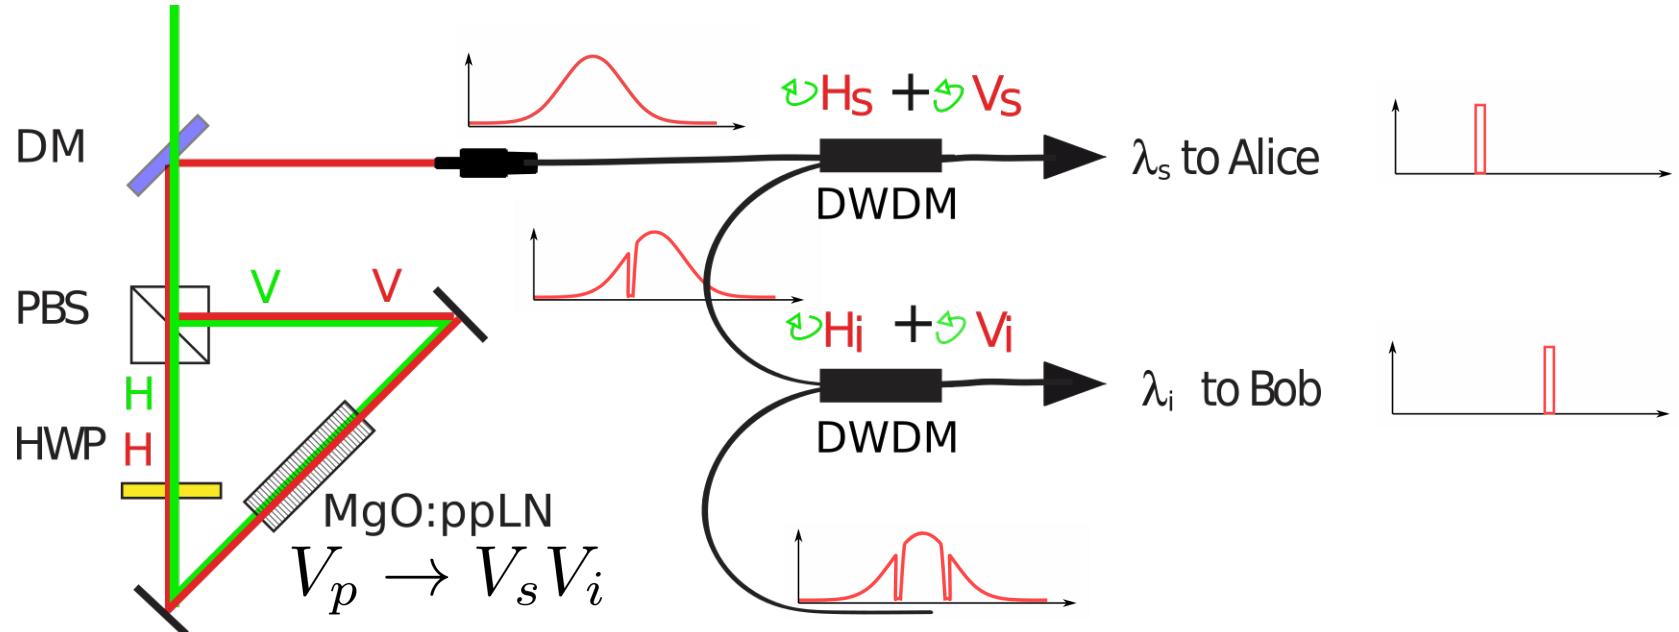

- 24 strands
- Deployed on ocean floor, partially buried
- NZDSF (“Corning Leaf”)
Dispersion: $6 \text{ ps}/(\text{nm}^*\text{km})$
- 4 Fibers are transmitting live internet data
- 2 Dark Fibers were used by us.

Setup

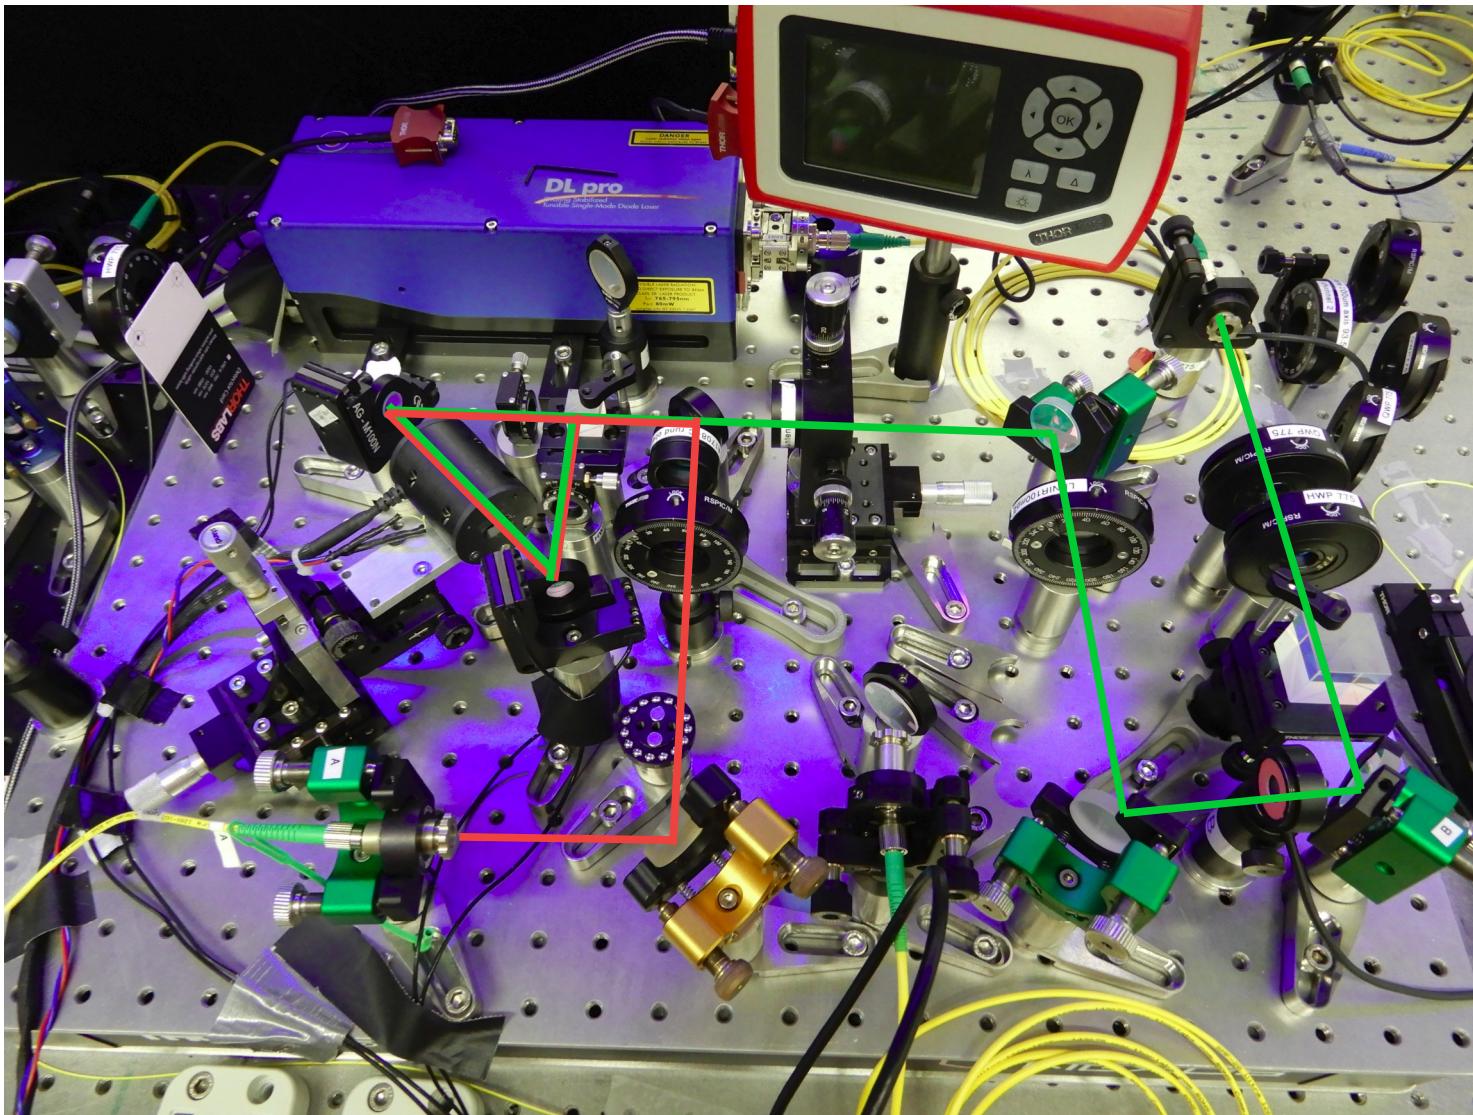

Type – 0 Sagnac Source

$$|\Phi\rangle = |\circlearrowleft\rangle + e^{i\varphi} |\circlearrowright\rangle$$

$$|\Phi^+\rangle = |H_s H_i\rangle + |V_s V_i\rangle$$

T. Kim, M. Fiorentino, and F. N. C. Wong, Phys. Rev.A73, 012316 (2006)

Malta

- Melita Datacenter

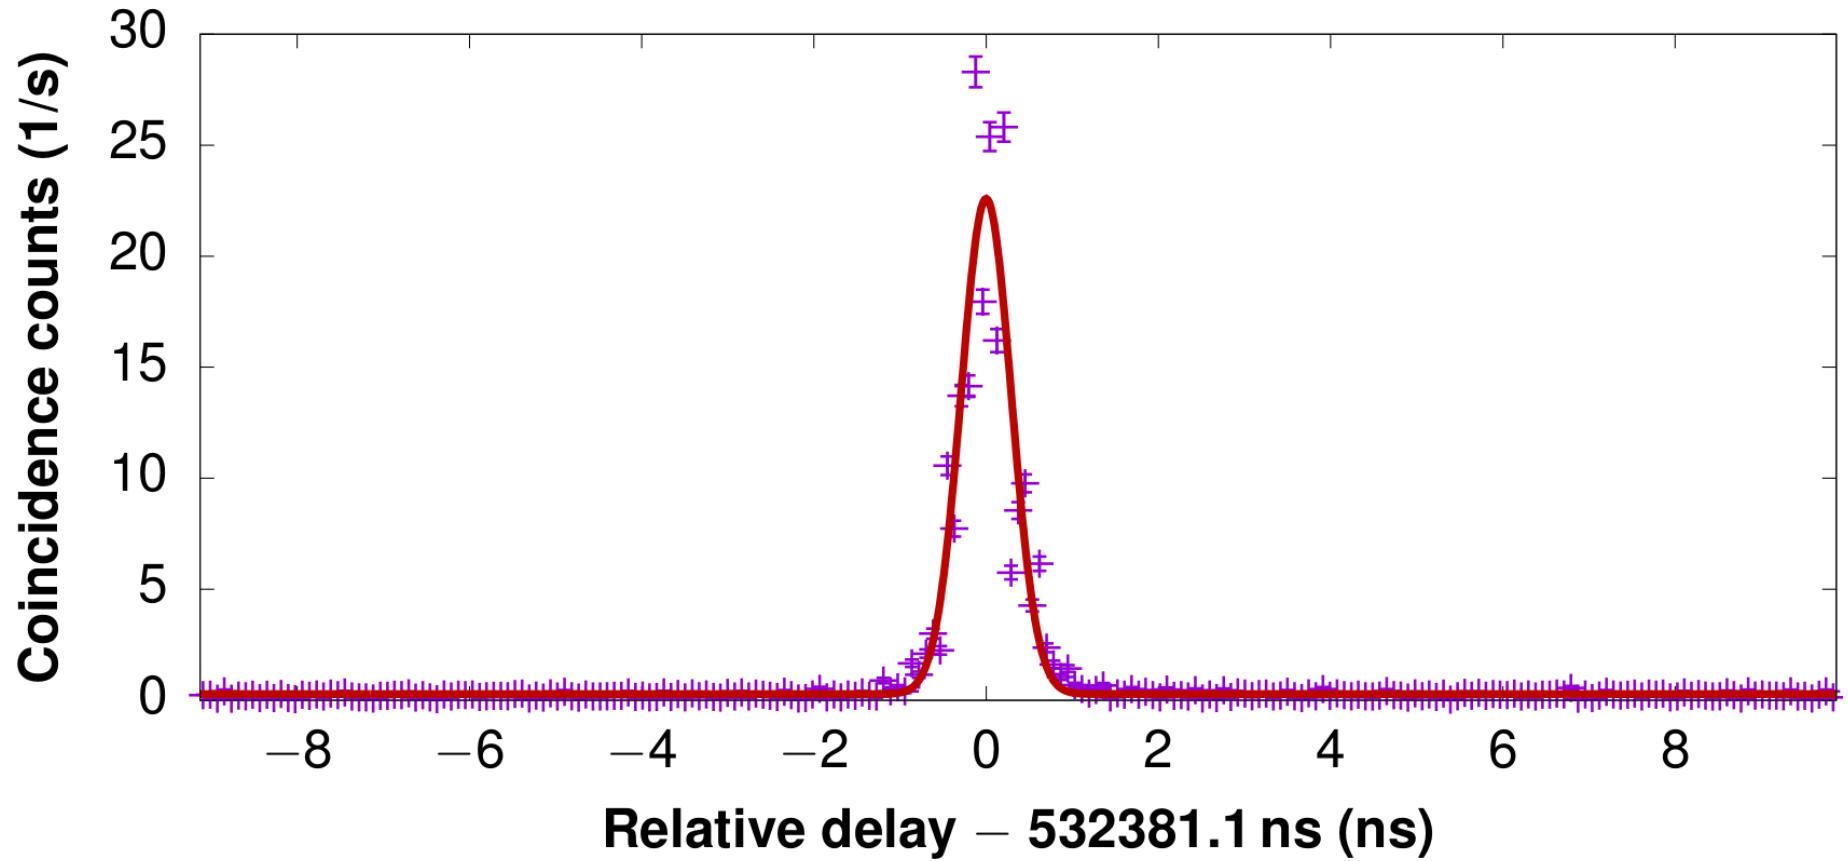

Pozzallo / Sicily

- Access through a manhole
- Receiver in a car

Cross-correlation

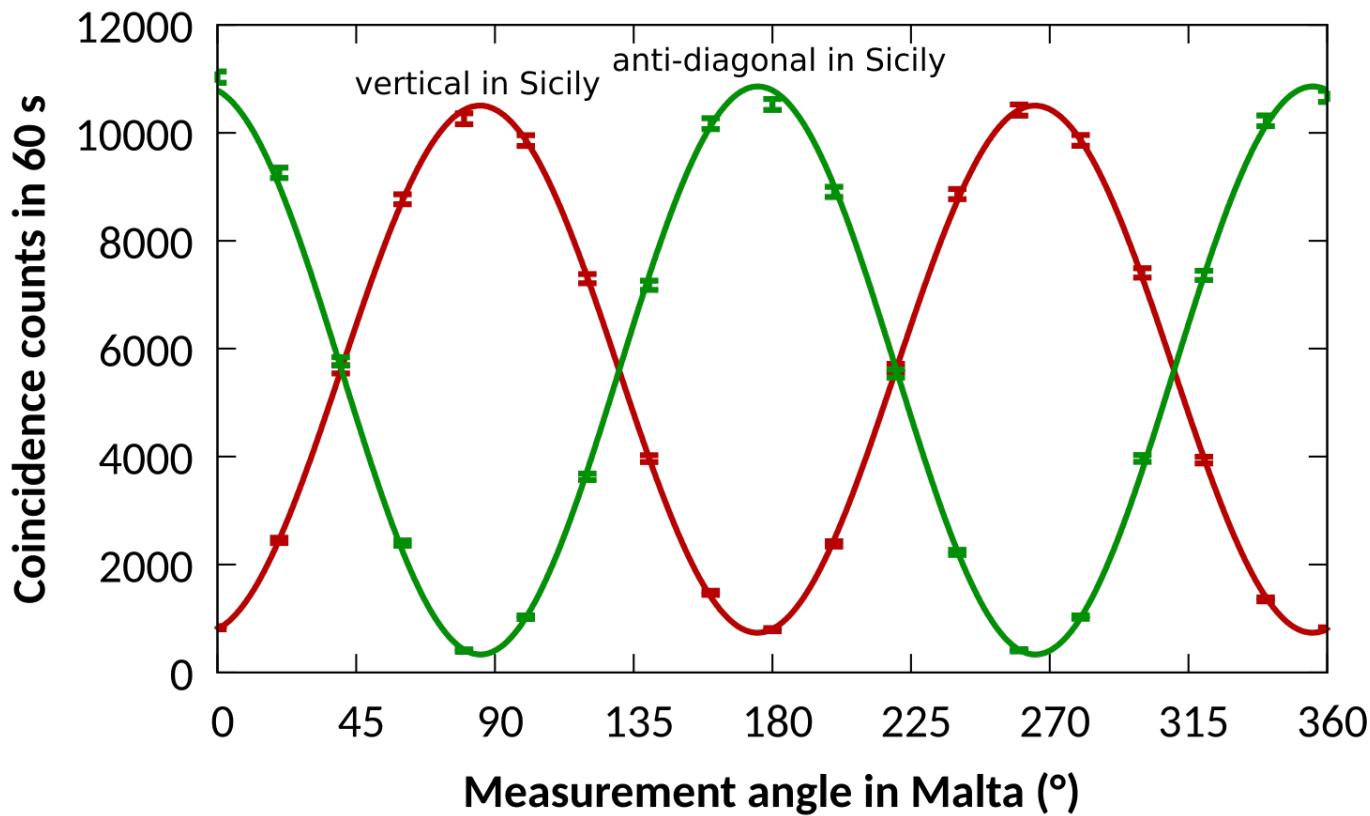

Integration time: 60 seconds, scaled to Hz

The FWHM ~ 0.7 ns (Gaussian)

- timing uncertainty of the SPADs in Sicily (approx. 450 ps)
- the dispersion of the fiber link (approx. 380 ps)
- other effects e.g. jitter of the time-bins in the time-tagging units (approx. 180 ps).

Visibility

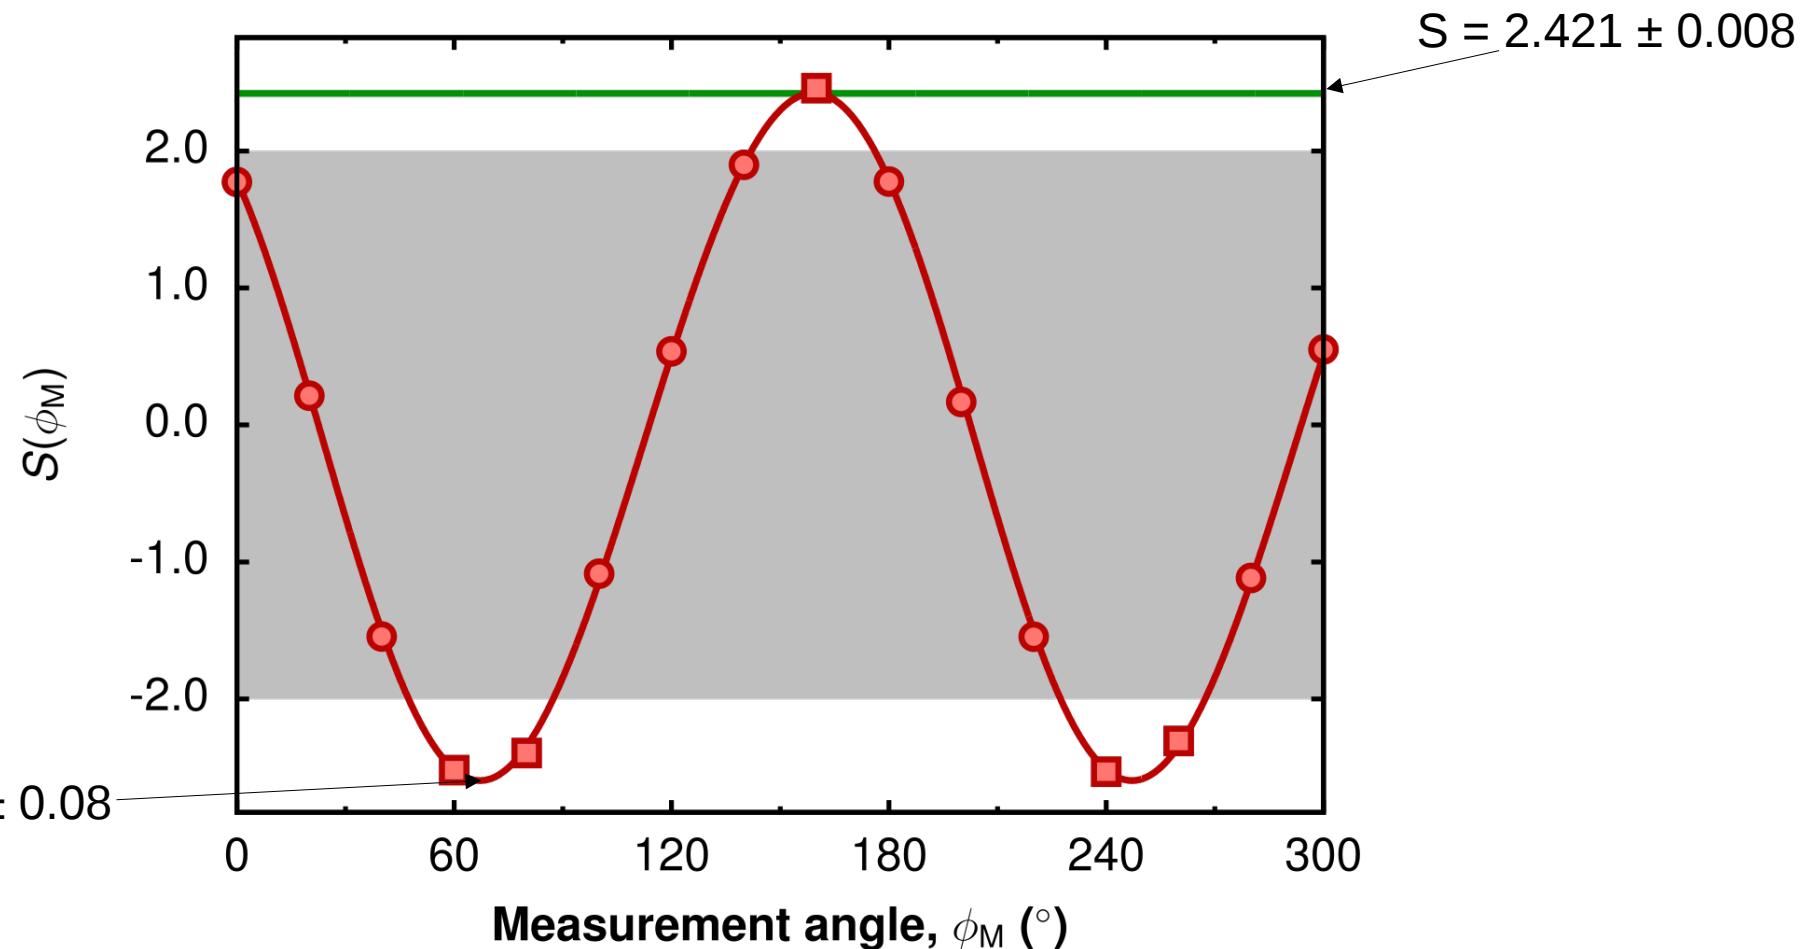

Results:

- Visibility:
 - HV: $86.8 \pm 0.8\%$
 - DA: $94.1 \pm 0.2\%$
- Coincidence rate ~ 250 Hz
- \Rightarrow Secure Key rate ~ 30 Hz

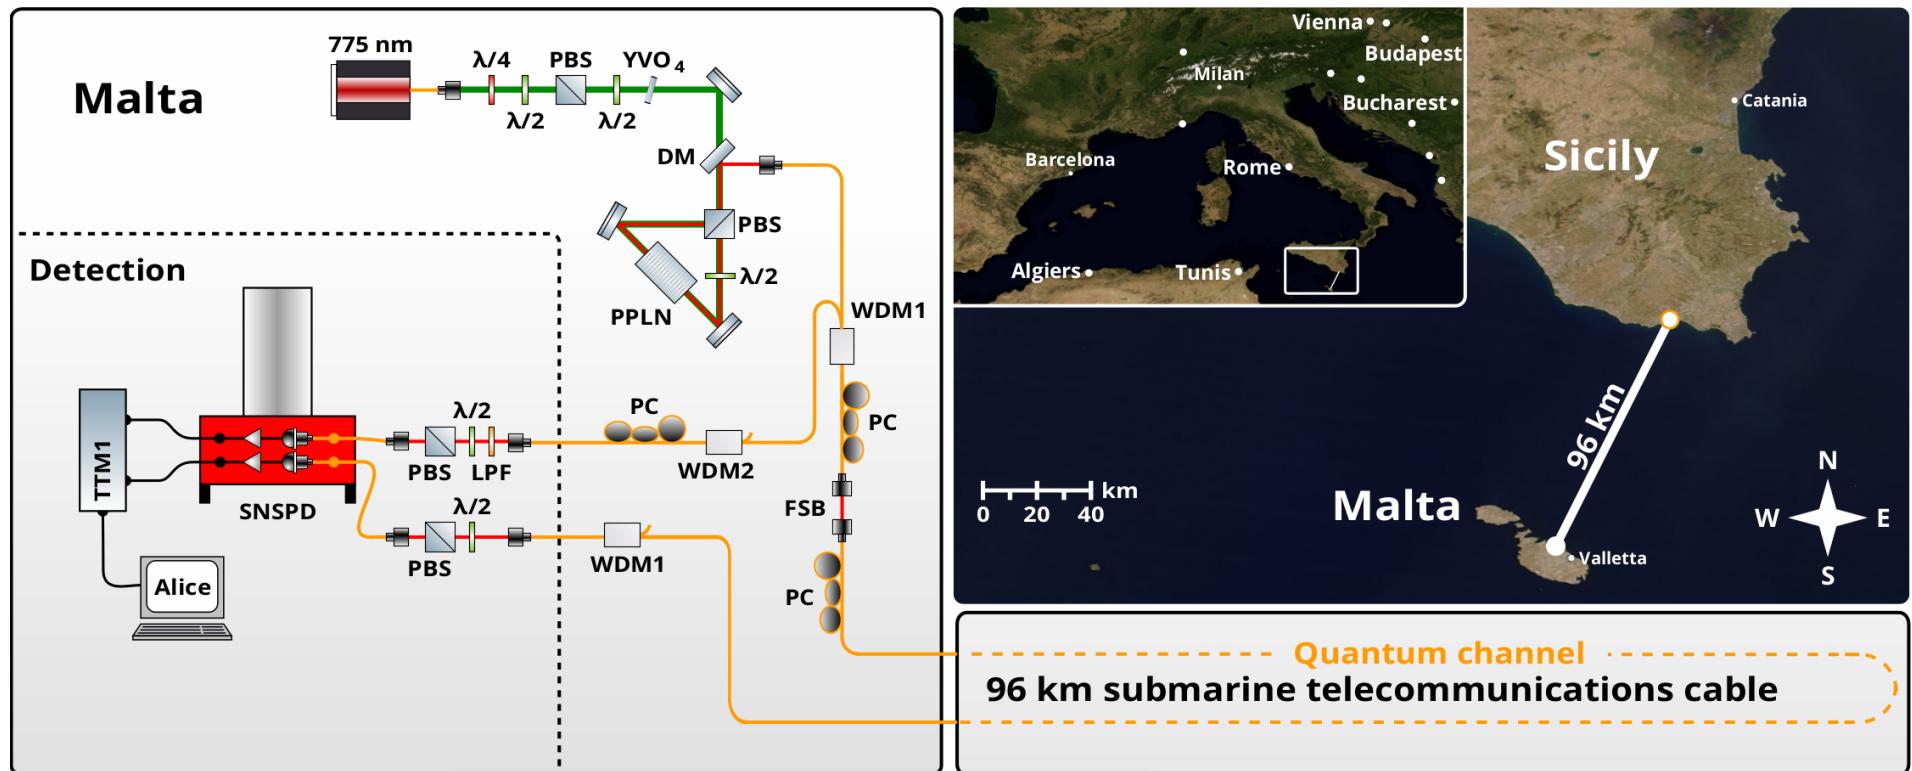

X. Ma, C.-H. F Fung, and H.-K. Lo Physical Review A 76.1 (2007): 012307.

CHSH Violation

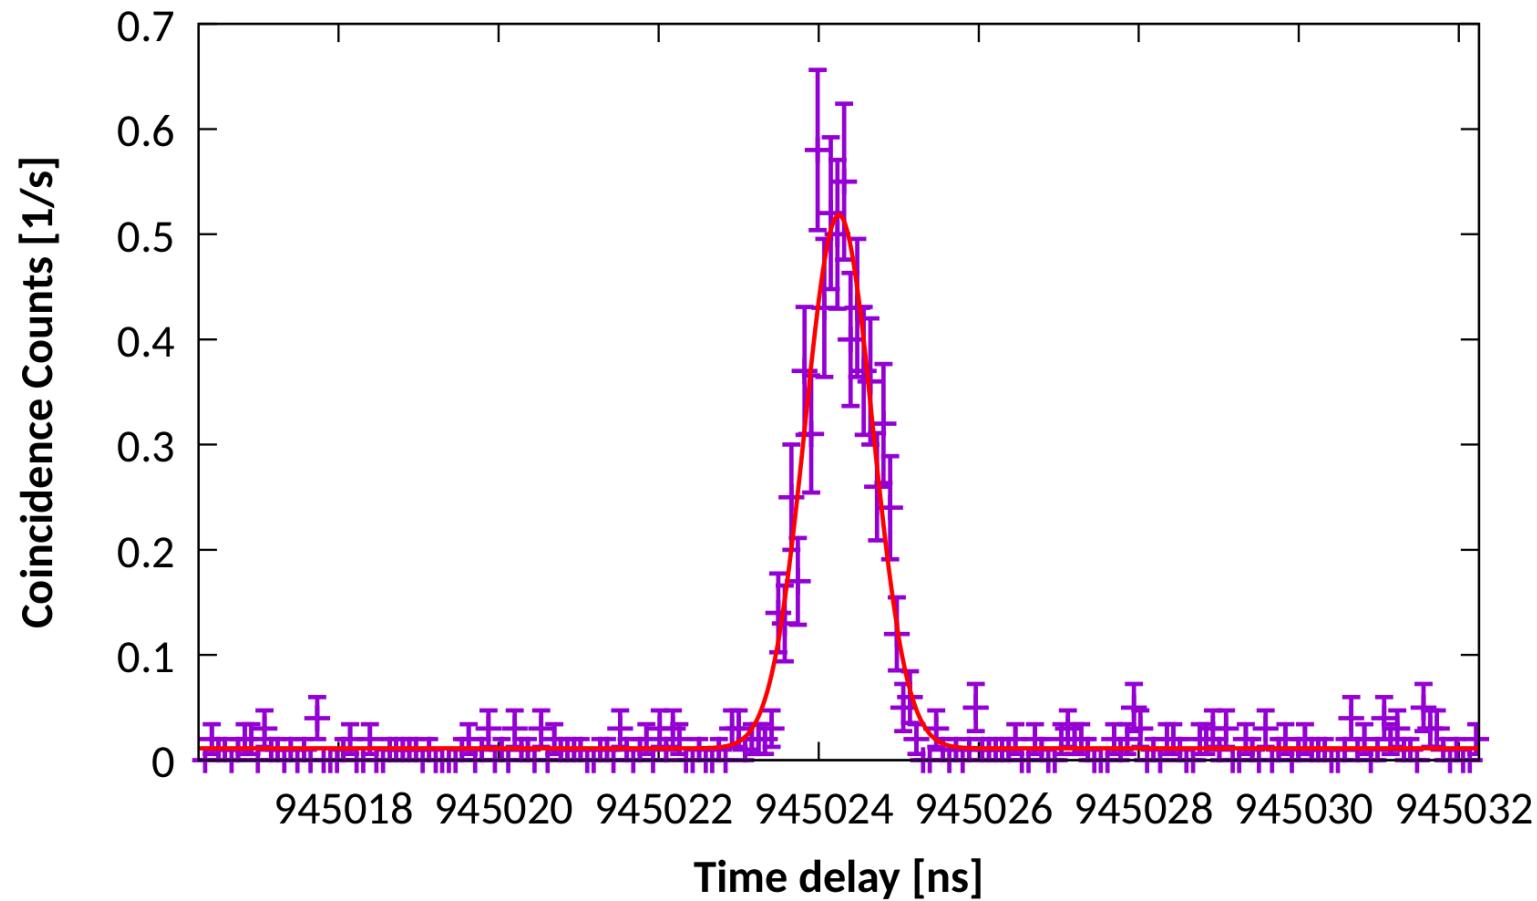

CHSH quantity $S(\phi_M)$ as a function of the measurement angle for the analyser in Malta, ϕ_M

Malta → Malta

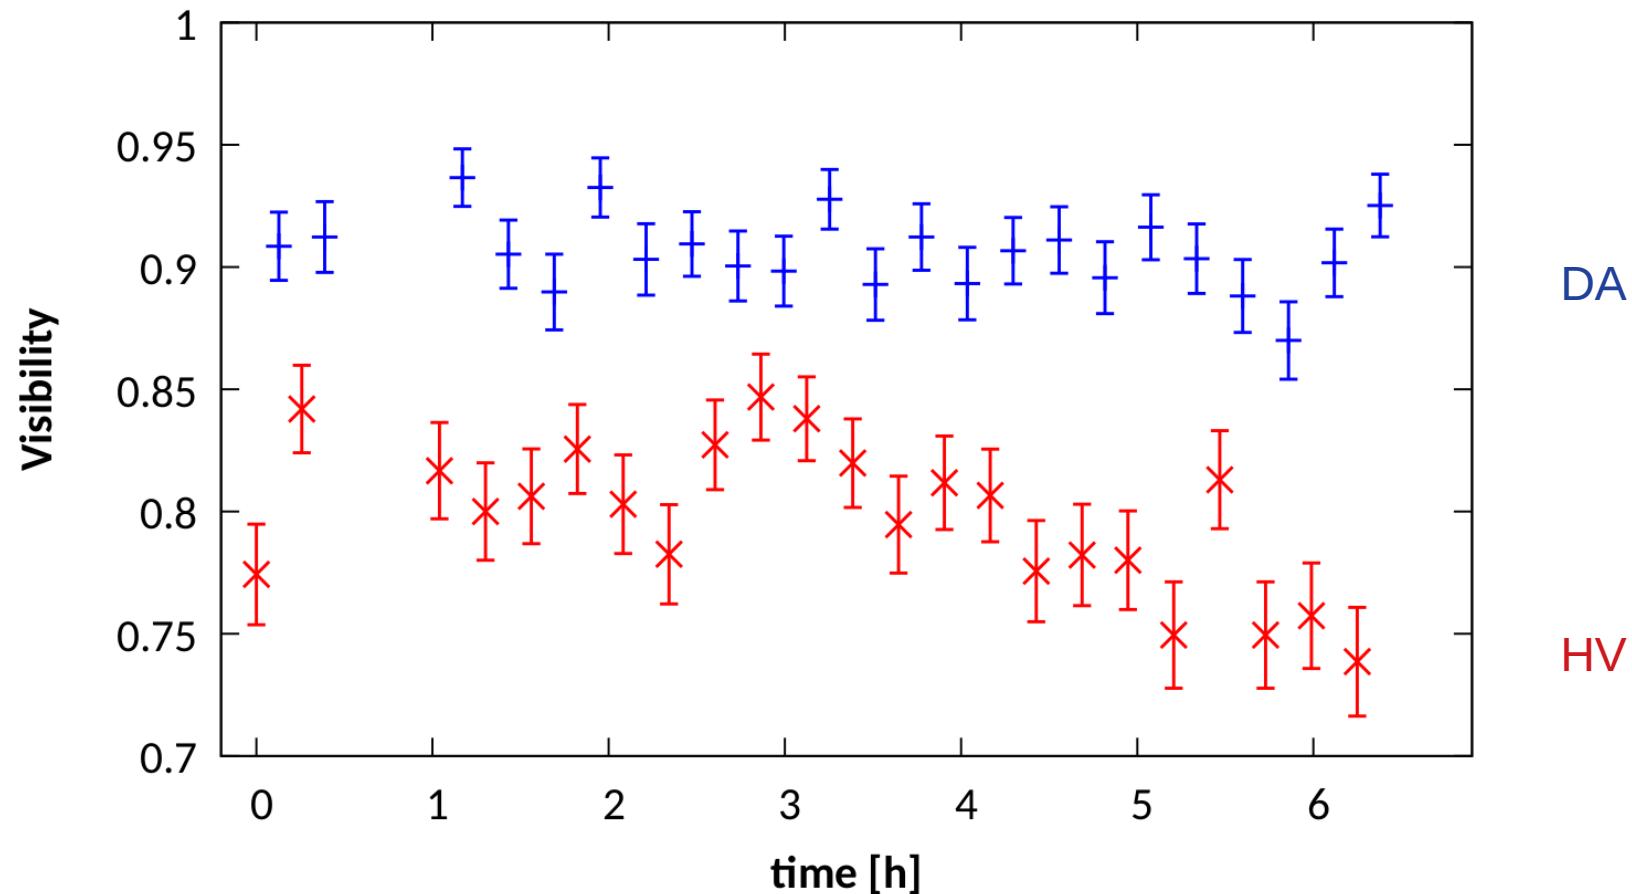

Cross-correlation

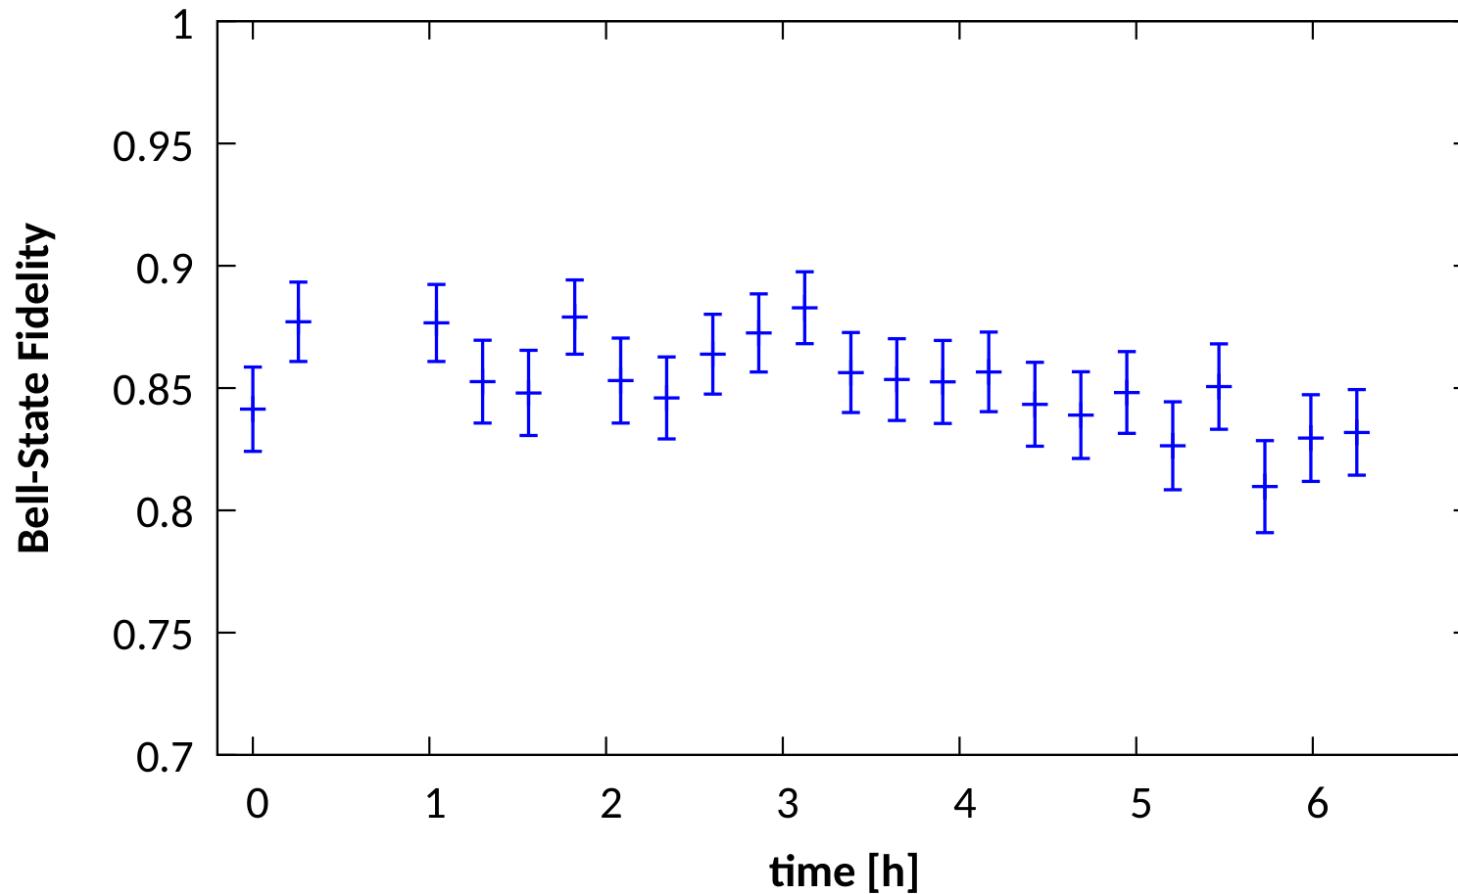

- 100 seconds integration time (~ 3.8 Hz)
- Fit: FWHM of 820 ± 20 ps
- ~ 760 ps chromatic dispersion
- FWHM of local measurement of the source and detectors: $\sim 250 \pm 20$ ps
- Distance compared to OTDR measurement – off by ~ 200 m

Visibility vs. time

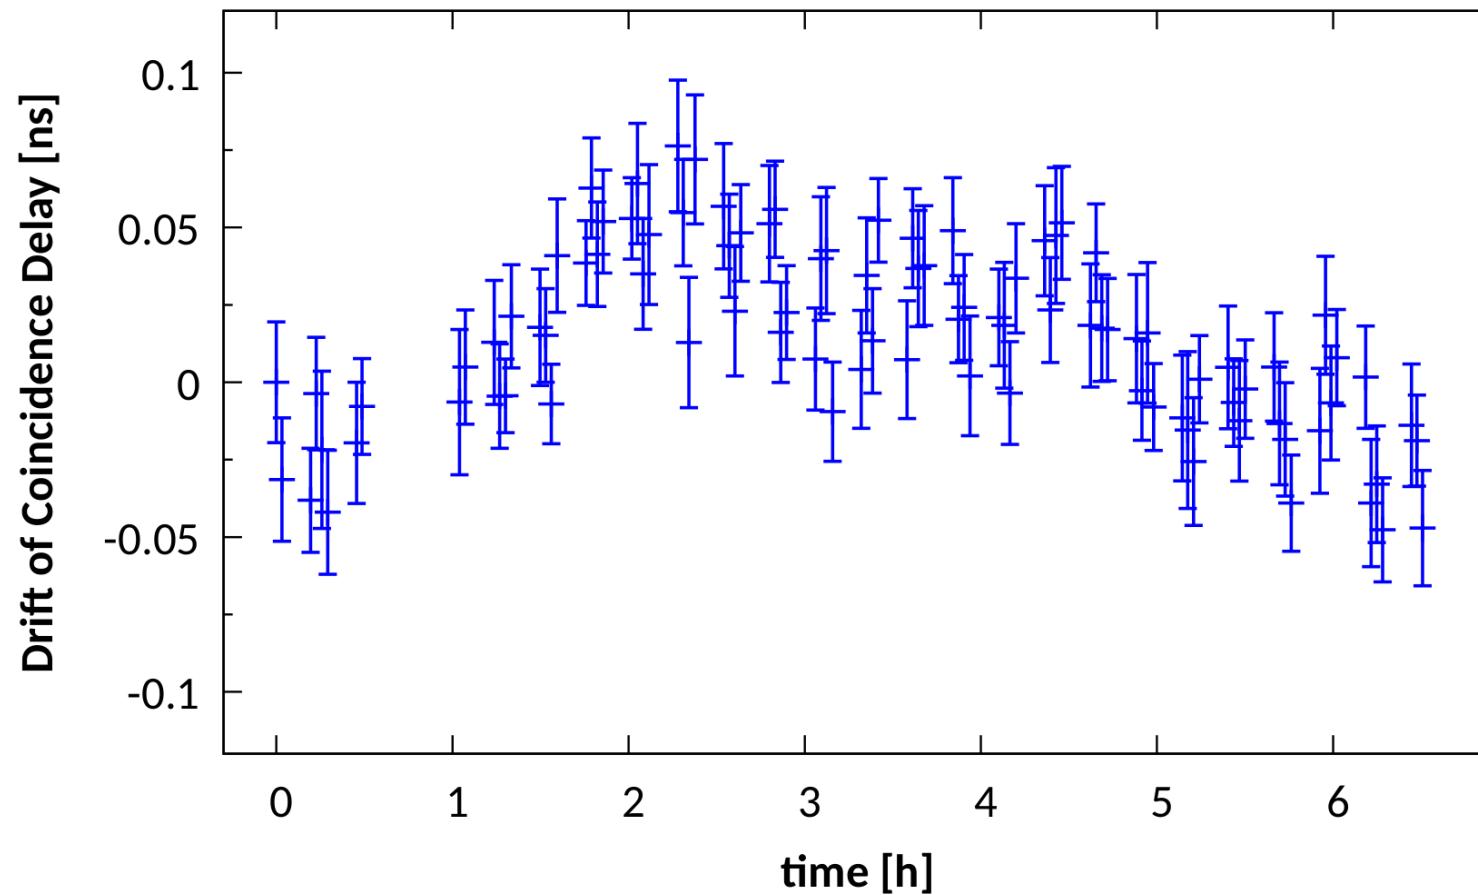

- Polarisation entanglement maintained over night, no significant drift over night
- Most symmetric values measured (not in graph): HV: 85 +- 2 %
DA: 86 +- 2 %
- Possible secret key rate: 0.4 Hz

Visibility vs. time

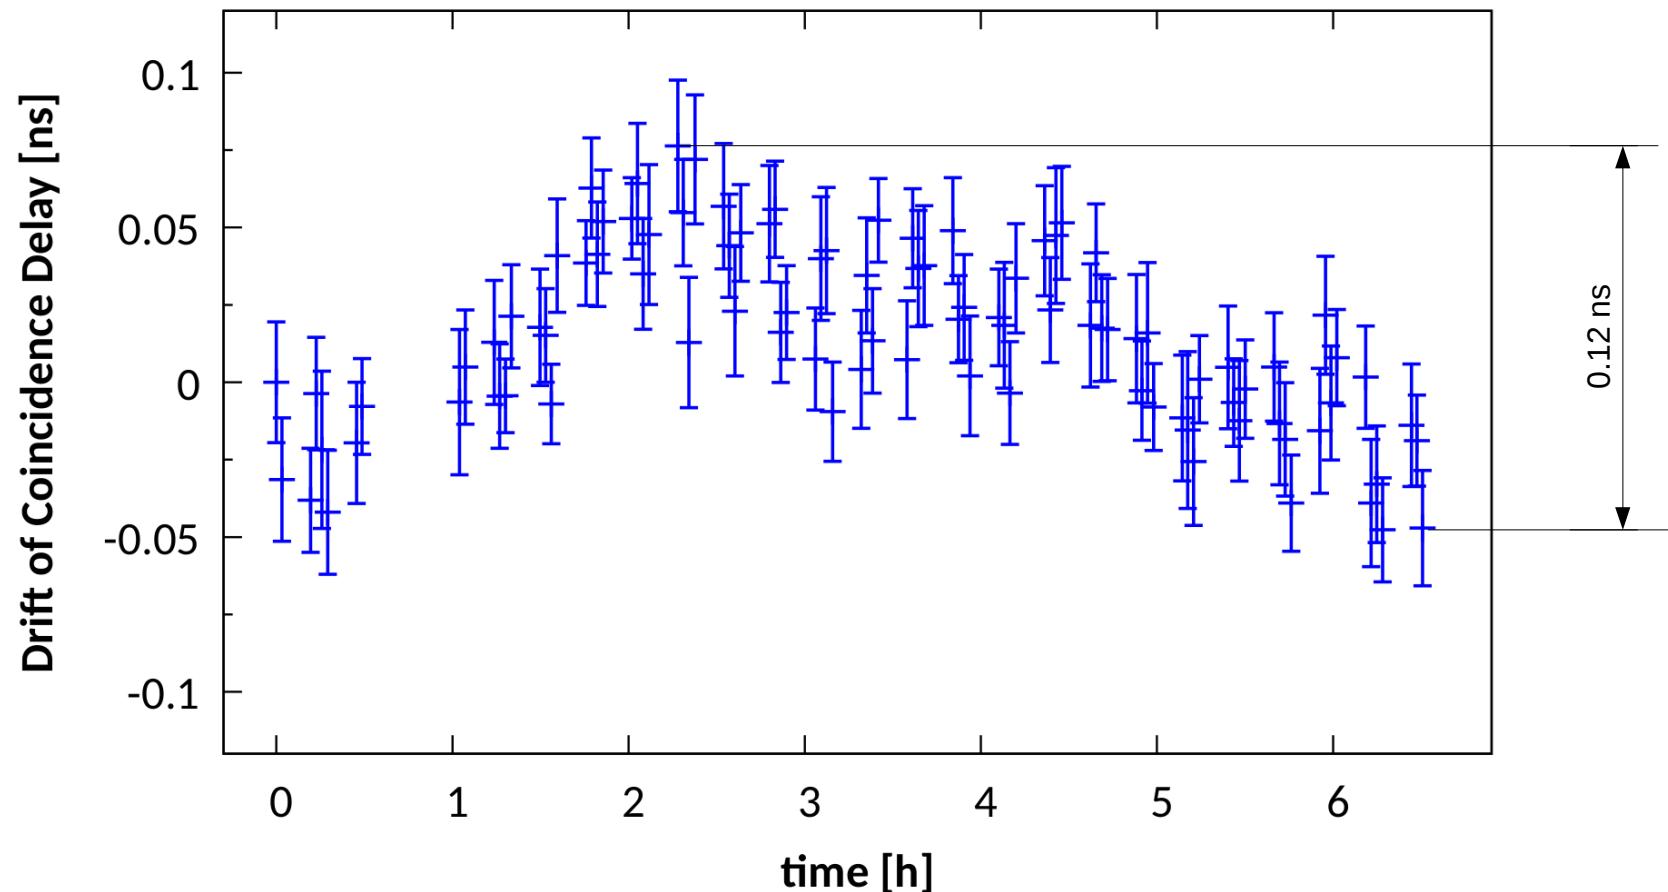

- Polarisation entanglement maintained over night, no significant drift over night
- Most symmetric values measured (not in graph): HV: 85 +- 2 %
DA: 86 +- 2 %
- Possible secret key rate: 0.4 Hz

Drift of Coincidence Peak

Drift of Coincidence Peak

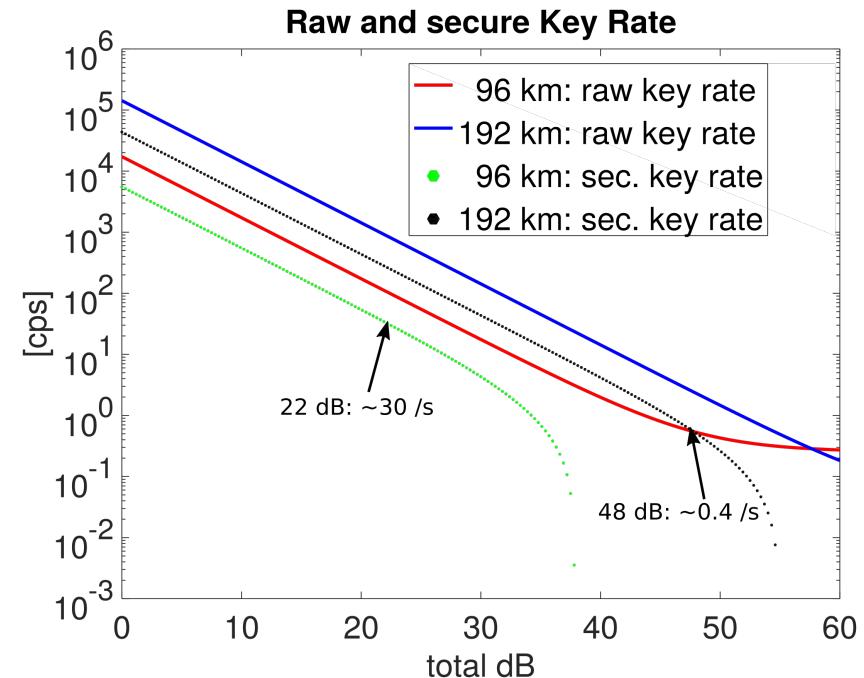

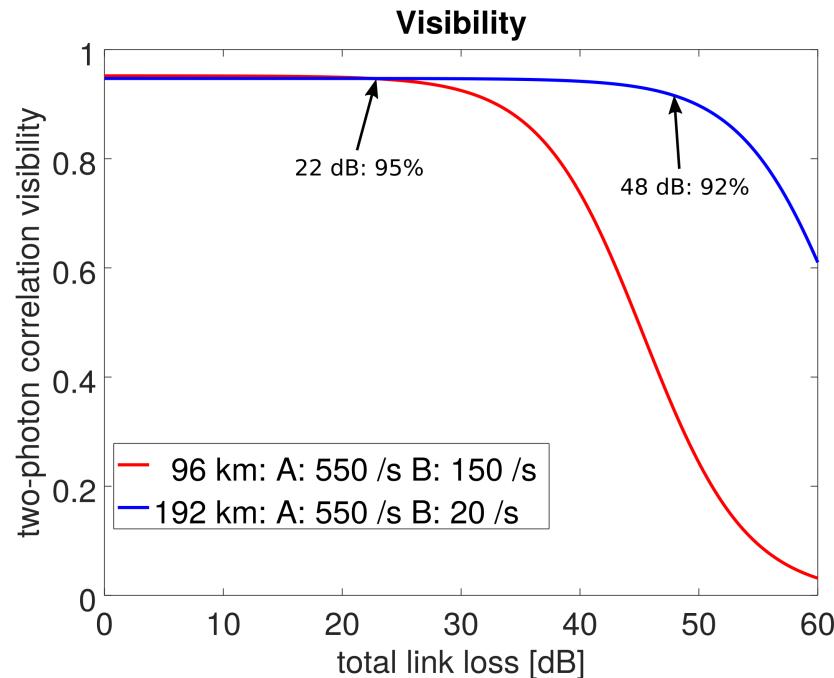

$$\frac{d(nL)}{dT} = L \underbrace{\frac{dn}{dT}}_{6.6 \times 10^{-6}} + n \underbrace{\frac{dL}{dT}}_{5.6 \times 10^{-7}}$$

- change of refractive index dominates
- Temperature change: < 30 mK
- length change ~ 3 mm

Link Budget

- Accidental coincidences deteriorate the visibility
- Detectors in Sicily: 10% and 3% efficiency (~550 and ~150 dark counts)
- SNSPD in Malta: ~60% (~550 dark counts)
- Bob SNSPD for 192 km Experiment: 12% Efficiency and 20 dark counts.
- Next Steps:
 - Dispersion Compensation
 - Detectors with less timing uncertainty

SNSPD dark counts

Source and SNSPDs locally

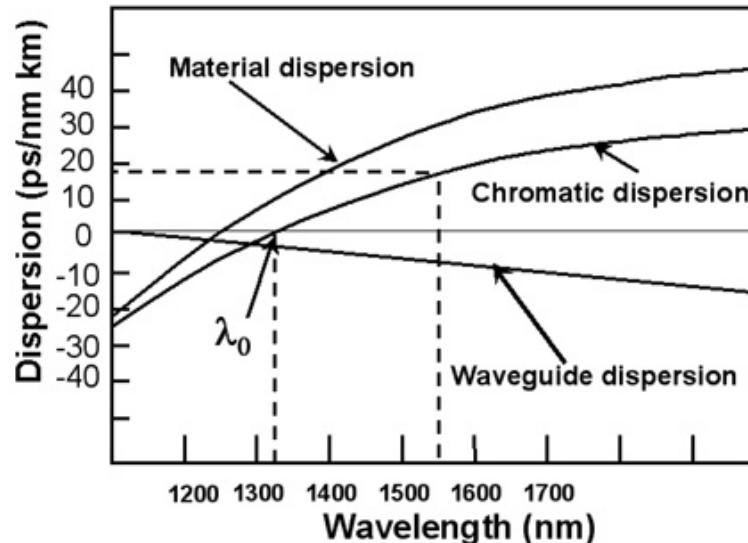

Visibility vs. time

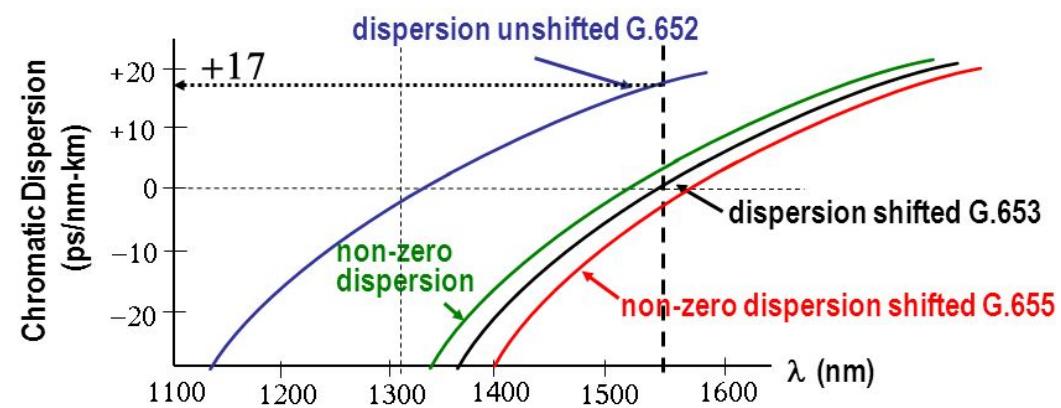

- Polarisation entanglement maintained over night, no significant drift over night
- Best values measured (not in graph): HV: 85 +/- 2 %
DA: 86 +/- 2 %
- Possible secret key rate: 0.4 Hz

Dispersion

$$D = \frac{-1}{c} \lambda^2 \frac{d^2 n_{eff}(\lambda)}{d \lambda^2}$$

- “Corning Leaf” (Malta-Sicily): 4.5 – 6 ps/(nm*km)
- SMF28: 17 ps/(nm*km)

Yariv, Yeh: Photonics, 6th Ed. 2009, Oxford University Press
